Technical Feasibility Review

Design1-Header.png -

This design will not take too long to create. It looks like a border style on the image. There are probably other border options that will give different looks, depends what the designer prefers. It would take about the same amount of time. I think it is an OK development choice, I would show some other mock-ups that look similar. The first step for me would be to start googling img border effects in CSS. I would try to find a recent tutorial/article with a lot of high ratings.

Design2-Signup01.png -

This design will take a little bit of more time to complete. It looks like a well styled form element, with different inputs, buttons, pictures, styling, etc. There are probably other options, but I think the amount of work will be about the same. I think it is a good development choice, it looks clean, simple, and intuitive. The first step would be to start researching form elements and different styling choices. From there I would then research form css examples and get some ideas on how to start styling the form.

Design3-Signup02.png -

This additional pop up window would take a moderate amount of time to complete. I don't think there are too many other options for the same effect or less work. I think it is an OK development choice. You could also make the back button inactive, and would not need to create the additional Javascript/error message from popping up. First step would be to research some javascript, find the function that does something when a button is clicked on and go from there.
